

**Adults with untreated hearing loss are less likely to participate in organized social activities, leading to feelings of depression.**

- Nearly 33% of adults 70 years and older have a hearing loss that impacts daily communication.<sup>1</sup>
- Less than 25% of adults with significant hearing loss use hearing aids.<sup>1</sup>
- On average, it takes people 7 years to seek treatment for hearing loss from the time they feel they are affected.
- Hearing loss can make it more difficult to interact with peers and can lead to decreased social engagement, depression, or bad moods.<sup>1</sup>
- There is a strong relationship between hearing loss and depression among US adults of all ages (18 and older).<sup>2</sup>
- Untreated hearing loss, social isolation, and depression can all contribute to an overall poorer quality of life.

**It is important to recognize early signs of hearing loss. Feelings of isolation and depression may be side effects of untreated hearing loss.**

**Consider a hearing test if:**

1. You sometimes feel embarrassed to meet new people because you have a hard time understanding.
2. You feel frustrated when talking to members of your family because you have a hard time hearing them.
3. You limit your personal or social life because of your hearing.

**Hearing loss may limit your social engagement and lead to depression if:**

1. You avoid simple duties.
2. You find yourself avoiding or withdrawing from social situations.
3. You feel alone even with family and friends.
